TaxPlan Advisor: performance and improvement report

Updated 29 October 2026 | 212 screenshot files checked | Cross-image validation, international feature research and conditional execution gates

Executive decision

TaxPlan Advisor has measurable audience demand, a visible sales pipeline and useful search assets. Its reporting does not yet establish which acquisition activity produces profitable customers. Reconcile commercial outcomes and investigate weak paid cohorts before increasing acquisition budgets. Sections 28-31 record the second-pass cross-check. Sections 37-41 integrate all 36 screenshots received on 29 October, updated research and execution conditions.

Organic Search shows strong engagement among the major first-user channels: 682 total users, 4m 55s average engagement per active user and 2.01 engaged sessions per active user. Paid Social brings 1,182 users but only 23s and 0.46 respectively. Later lead reports establish that Paid Search supplies 39 of 73 recorded new lead-users and Paid Social 17; together they provide 76.71% of recorded leads. Strong engagement and lead volume are distinct signals, and neither establishes profitability.

The most important reporting gap is after lead acquisition: GA4 records 73 new lead-users but zero qualified/converted leads and zero reported purchasers/revenue, while the CRM shows 93 wins. The campaign-import report also shows 0/12 join coverage in its displayed scope. Different periods and populations prevent direct reconciliation; these gaps prevent reliable acquisition-cost and revenue-return assessment.

New finding on 29 October: 99.62% of displayed views have no named content group; the remaining displayed label is blank. Prioritise useful service grouping alongside commercial reconciliation. Updated activity counts do not establish improved sales or implemented fixes. See sections 37-41.

Three immediate priorities:

- Measurement: verify the existing lead trigger, connect CRM lifecycle changes and verified payments, and reconcile campaign spend using identifiers and consistent dates.
- Acquisition: investigate the first-user medium 'paid' (5s engagement) and campaign 6977406146903 (26.0% session engagement). Do not label either fraudulent or unprofitable without further evidence.
- Product trust: review the partnership calculator's publicly retrieved rule text, which displays older thresholds. Confirm the applicable year and calculation logic before using it to acquire more customers.

Status: analysis, calculations, researched benchmarks and repair specifications completed. No website, CRM, advertising or GA4 settings were changed. The user confirmed that access to those systems is unavailable.

Scope and evidence rules

This report incorporates nine distinct batches of supplied screenshots: 176 files, including overlapping views. Resends of the same files are counted once. Sidebar and disk-storage images are outside the business-performance scope. Public pages and official documentation were researched on 28 October 2026; retrieved pages may be cached and have different crawl dates. Sections 12-19 contain the international research expansion; sections 20-27 incorporate the latest 96 images and revise the commercial priorities. All images were considered; the report references them rather than embedding every image.

Most latest GA4 views show 1 January-28 October 2026. The latest date is a partial day and may still be processing. Earlier views cover 28 September-25 October and 1-25 October. CRM screenshot 2026-10-27 101535 has no visible date filter. Keep these populations separate.

Evidence labels used here: Observed = visible screenshot or retrieved public text; Derived = calculation from visible values; Hypothesis = plausible explanation requiring verification; Proposed = future action or target. No hypothesis is presented as a confirmed implementation defect.

The screenshots cannot establish ad spend, CAC, ROAS, gross margin, exact paid revenue, refund-adjusted sales, the cause of traffic spikes, or the quality of the underlying tax calculations. Competitor features are vendor-described capabilities, not independently tested outcomes.

1. Business scorecard

The following exact values establish the earlier baseline snapshot. Audience table date is inferred from adjacent views in the same sequence; its cropped image does not independently show the date. Later captures in section 24 show 8,917 total users and 197,221 events, while page reports show 8,912 active users. Retain capture-specific counts rather than silently forcing every view to match.

Metric	Observed value	Interpretation
Total users	8,916	GA4 audience/acquisition tables
New users	8,859	Not equivalent to new customers
Returning users	924	Can overlap with new users during the period
Sessions	16,136	Audience table
Views per session	4.46	Browsing depth; not a conversion metric
Average session duration	4m 01s	Distinct from active engagement time
Average engagement per active user	2m 27s	Acquisition table
Engaged sessions per active user	1.19	Not an engagement percentage
Event count	197,215	Includes all events, not just leads
Recorded new leads	73	Later lead report; unique generate_lead users, not raw submissions
Qualified / converted leads	0 / 0	GA4 lead overview
CRM total leads / won	5,701 / 93	CRM period and inclusion rules unknown
Paid via WhatsApp	21	Relationship to wins unknown
CRM hot / warm / cold / unassigned	35 / 60 / 428 / 6	These labels need not partition the full pipeline

Derived: 16,136 / 8,916 = 1.81 sessions per total user. Returning users / total users = 10.36%, a descriptive period ratio, not cohort retention. New and returning categories overlap, so do not add them to recreate total users. See Google's user definitions [S1].

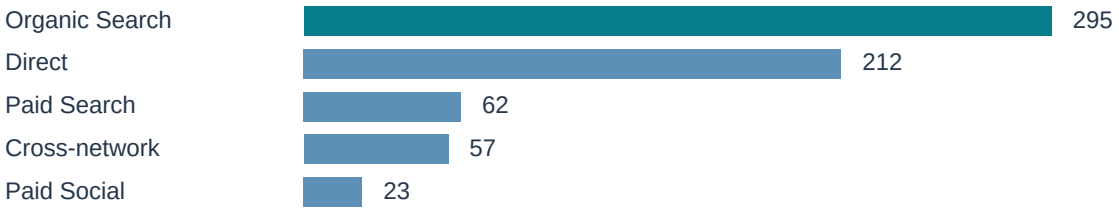

Derived: 93 / 5,701 = 1.63% observed CRM won-to-total ratio. It is not a cohort conversion rate: some leads may be recent, imported, duplicated or outside the relevant website period. Do not divide CRM wins by GA4 visitors to claim a website conversion rate.

The paid-revenue tile is clipped after approximately INR 48,494. Its full amount, period and definition are unavailable. No average order value or revenue forecast is calculated from it. The 21 paid-via-WhatsApp count may overlap the 93 wins; do not sum them.

Earlier 28-day snapshot: 581 active users, 532 new users, 5m 23s average engagement and about 11K events. It cannot be compared directly to annual totals as growth or decline.

2. Acquisition quality and traffic concentration

Engagement time per active user (seconds)

First-user channel grouping, 1 January-28 October 2026. Time is average engagement per active user. E/S is engaged sessions per active user. Source: screenshots 095017, 095039, 095121 and 095132.

First-user channel	Total users	Share	Time	E/S
Direct	4,042	45.33%	3m 32s	1.57
Cross-network	1,596	17.90%	57s	0.73
Paid Social	1,182	13.26%	23s	0.46
Paid Search	1,018	11.42%	1m 02s	0.73
Organic Search	682	7.65%	4m 55s	2.01
Organic Social	279	3.13%	2m 01s	1.17
Paid Other	51	0.57%	33s	0.55
Referral	36	0.40%	4m 02s	1.31
AI Assistant	28	0.31%	14m 49s	1.04
Unassigned	20	0.22%	1m 45s	1.25

Only 10 of 11 channel rows are visible. Their sum is 8,934, slightly above the displayed 8,916 total; report row counts as displayed rather than forcing a reconciliation. Exact causes require the export, identity settings and metric definitions. Do not invent the unseen channel or reweight rows.

Organic Search contributes 225 of 924 returning users (24.35%) while representing 7.65% of total users. This makes it a strong candidate for conversion optimisation. Some visits may be branded searches, existing clients or staff; organic traffic is not automatically incremental demand.

Paid Social engagement time is about one-thirteenth of Organic Search (295 / 23 = 12.8). Investigate ad-to-page relevance, mobile loading, geography, placement and consent behaviour. Low engagement alone does not prove poor sales performance.

Direct represents 45.33% of users and 62.49% of events. This may combine brand demand, untagged messages, return visits and internal activity. It is not evidence that 45% of acquisition is free or brand-driven.

The monthly chart peaks in June, declines through September and rises in partial October. The daily chart shows a very concentrated late-June spike. Campaigns, publicity, measurement changes and invalid traffic are competing explanations. Compare matching elapsed days, campaign logs and lead quality; do not annualise this spike.

AI Assistant traffic is only 28 users. Its long engagement time is interesting but too small to justify a major budget shift. A few sessions or internal users could materially affect its average.

3. Campaign and medium diagnostics

These are session-based manual campaign reports, not first-user channel reports. Engagement rate below is engaged sessions / sessions for matching campaign rows. Source: 2026-10-28 093858 and 093909.

Campaign label	Sessions	Engaged	Derived rate
23881032605	760	517	68.0%
23948155089	544	415	76.3%
1000OFF_ITR	377	266	70.6%
ITR_Filing	226	177	78.3%
6977406146903	323	84	26.0%

Campaign 6977406146903 trails ITR_Filing by 52.3 percentage points of engagement. First investigate its actual platform, dates, audience, placement, creative and landing page using the campaign ID. The number alone does not identify the platform. Review qualified leads and contribution margin before a spend decision.

For the discount-labelled 1000OFF_ITR campaign, measure discount-adjusted gross profit and qualified lead rate. Its label does not prove the actual discount paid or the final offer terms.

Session manual medium	Sessions	Engaged	Approx. rate
organic	3.8K	2.6K	68.4%
cpc	1.6K	1.2K	75.0%
referral	1K	759	75.9%
paid	760	191	25.1%
paid_social	579	389	67.2%
social	72	49	68.1%
ai-assistant	5	4	80.0%

K-rounded inputs make several percentages approximate. Five AI-assistant sessions cannot support a performance conclusion. Session-source figures include google 5.3K / 3.6K engaged, ig 726 / 331 and fb 586 / 234; respective approximate engagement rates are 67.9%, 45.6% and 39.9%. These source labels do not separate paid from organic by themselves.

The first-user medium 'paid' is a separate view: 737 total users, 739 new users, 5s average engagement and 0.26 engaged sessions per active user. Preserve the displayed anomaly of new users exceeding total users as a reconciliation issue. Do not equate this row with the session-medium group or with campaign 6977406146903 without a joined export.

Empty manual-source-platform cards can reflect an unpopulated optional tagging dimension, not a complete analytics outage. Add utm_source_platform where useful, or use a populated source-platform report. Numeric campaign names are usable IDs; add a maintained ID-to-name lookup. Standardise new naming, retain raw historical values, and do not rewrite past attribution [S2].

4. Search, content and retention opportunities

Approximate page CTR calculated from matching visible click and impression rows for the latest year-to-date view. Inputs are rounded; verify exact date, search type and filters before acting.

Page	Impressions	Clicks	Approx. CTR
Homepage	19K	2.4K	12.6%
Partnership calculator	22K	466	2.12%
Capital-gains calculator	7.3K	86	1.18%
About	4.2K	58	1.38%
Contact	3.5K	28	0.80%

The homepage's separately displayed CTR is 12.7%; rounding explains the approximate calculation. Do not compare its largely branded intent directly with calculator searches as if both should have the same CTR.

The leading visible click queries are brand variants. Non-brand visibility exists: partnership calculator 22K impressions; a tax-audit due-date article 11K; capital-gains calculator 7.3K. The due-date article's matching clicks are not shown, so its CTR cannot be calculated.

Prioritise a verified, year-labelled partnership calculator with an expert-review call to action after the result; then capital-gains guidance linked to the relevant service. Display service scope, documents required and a clear next step. Audit content accuracy before changing titles to increase traffic.

Scenario, not forecast: at unchanged 22,000 impressions, raising partnership CTR from 2.12% to 3.0% implies about 194 additional clicks. At hypothetical 3% accepted-lead and 20% lead-to-paid rates, that yields about 1 additional customer. The example shows why improved CTR must connect to a measured sales funnel; it is not a business prediction.

Average position is a ranking measure: smaller is better. Query values such as 130, 112 and 110 in the truncated 'average position' cards are not clicks. Desktop 18 versus mobile 9.8 suggests different search visibility, not a page-speed score. Country rows with high numerical positions do not prove irrelevant paid targeting. Google explains the calculation and its limitations [S3].

The 100% engagement and CTR cards are sorted top rows without volumes. They may represent tiny samples; a /404 entry is not proof that errors convert well. Investigate missing URLs and entry paths. Normalise nonfunctional query parameters for reporting after retaining attribution; do not delete functional calculator parameters.

The six-week cohort card shows 5.8%, 3.1%, 2.4%, 0.8% and 0.0% across later weeks. Newer cohorts have not matured. Annual tax filing is also seasonal, so weekly visits alone are a poor retention objective. Measure repeat service purchases, filing completion, subscription renewal and document turnaround separately. Returning users in Virar/Vasai-Virar may include staff, customers or location classification effects; geography alone cannot identify employees.

5. Prioritised issue register

P0 means address before relying on outcome reporting or affected tax outputs. P1 means investigate in the next delivery cycle. Every item below is a proposed fix, not a completed production change.

Priority / issue	Evidence and confidence	Required remedy
P0: Missing lead outcomes	GA4 0 qualified/converted; CRM 93 wins. Observed gap, root cause unconfirmed.	Map CRM lifecycle events, align definitions/dates, reconcile unique IDs.
P0: Revenue not visible	Empty source/medium/campaign revenue cards; CRM paid tile exists.	Verify successful-payment events and net revenue in finance; reconcile by order ID.
P0: Calculator rule text	Retrieved partnership page shows older thresholds. Text observed; algorithm untested.	CA review of year selection, explanatory copy and computation, with versioned fixtures.
P1: Development attribution	localhost:8080 = 121 sessions; localhost:3000 = 111.	Inspect event hostnames/referrers; separate development collection and staff reporting.
P1: Weak paid traffic	5s in first-user paid medium; 26.0% engagement for one campaign.	Join campaign to landing page/device/lead quality before changing spend.
P1: Attribution governance	Mixed paid/paid_social, ig/fb; numeric campaigns.	UTM registry, documented mappings, campaign IDs and landing-page QA.
P1: Operational funnel check	Six marked unassigned; no visible disqualification reasons. Main bottleneck unproved.	Inspect ownership and ageing first; configure next action, timestamps, reasons and escalation where needed.
P1: Search/report clutter	fbclid variants, /404 and admin route appear.	Normalised marketing views; error-route audit; staff/customer segmentation.
P2: Audience segmentation	Only All Users visible.	Add intent and lifecycle audiences after events work; respect consent.

232 localhost-labelled sessions are 1.44% of 16,136 total sessions if the scopes match. This is a diagnostic count, not a verified contamination percentage: a localhost referrer may lead to a real production session, and staff traffic may use ordinary sources. The /whatsapp-admin page has 277 engaged sessions; confirm whether these are staff activities before excluding anything.

The public search index also surfaced testing.taxplanadvisor.in. This warrants checking staging authentication and indexability. It does not establish current production duplication or prove that private data is public. Use staging access control and appropriate noindex handling; robots.txt alone is not access control.

Calculator detail: retrieved text states first INR 3 lakh of book profit and an INR 1.5 lakh floor. The Income Tax Department's Section 40 amendment notes substitute INR 6 lakh and INR 3 lakh respectively from 1 April 2025 [S4, S5]. This is a content/versioning discrepancy for review, not proof that the live algorithm is wrong. The applicable financial/assessment year and subsequent legislative mapping must be signed off by the tax owner. Keep historical rules for historical years rather than blindly replacing constants.

6. Repair specification for the delivery team

A. Measure real outcomes

Use a single internal lead ID and order ID across forms, CRM and payments. Store consented attribution at lead creation, including original source, campaign, landing page, timestamp and supported analytics identifiers. Preserve first touch and lead-creation touch separately. Keep names, phone numbers, emails, PAN and document contents out of GA4.

Recommended lifecycle mapping: verify the existing generate_lead after a successfully accepted enquiry; working_lead when a representative contacts or is contacted by the lead; qualify_lead after documented qualification; disqualify_lead with a controlled reason; close_convert_lead at the defined customer transition; close_unconvert_lead for a closed loss. A WhatsApp click is an intent event, not automatically a generated or converted lead. These event names follow Google's recommendations [S6].

Send purchase only for verified successful payments, with transaction_id, INR currency, numeric value and service items; handle refunds separately [S7]. Do not expect a generic lead-event value to populate purchase revenue. Define treatment of tax, discounts, refunds and partial payments with finance. Distinguish booked contract value from cash collected.

Server events should follow authenticated CRM/payment changes, use application-level idempotency, retry logs and a durable delivery record. Keep API secrets server-side. Use consent-compatible identifiers and supported attribution/time windows; do not manufacture historical sessions or force old CRM wins into today's GA4 conversions. Preserve historical reconciliation in the CRM/warehouse if analytics backfill is unsupported.

Acceptance: a valid test enquiry creates one CRM lead and one lead event; retrying does not duplicate it. Invalid forms create neither. Stage changes produce the correct event once. A failed payment creates no purchase; a successful payment creates one order; retries do not multiply revenue; refunds reconcile. Test consent denial and check payloads for personal data. Validate Measurement Protocol payloads, then check delivery in the correct property; a 2xx response alone does not prove acceptance [S8].

B. Clean collection and attribution

Restrict production analytics to intended production hosts. Use separate test collection for local/staging environments. Identify staff traffic through verified mechanisms; test internal-traffic filters before activation because active filtering permanently changes incoming data [S9]. A referral-exclusion setting alone does not remove test traffic.

Use consistent campaign tags: utm_source=instagram, utm_medium=paid_social, utm_campaign=itr_salary_2026_oct, plus a stable campaign ID and optional platform. Use these as proposed conventions, not retroactive truth. Test redirects, link shorteners, WhatsApp links and payment return paths so attribution survives. Retain Google auto-tagging where applicable and avoid conflicting manual tags.

Maintain raw URLs securely and a normalised reporting path. Remove fbclid and other nonfunctional tracking parameters only from the reporting grouping after acquisition is captured. Preserve functional parameters, such as calculator mode. Test customer login, service booking and payment separately from staff administration.

C. Repair the operating funnel

Define qualified lead as reachable contact + relevant service need + serviceability + an agreed buying timeline, adjusted to the business. Require assigned owner, next-action date, created/first-contact/qualified/won timestamps and controlled loss reasons. Separate lead temperature from lifecycle stage and payment status.

Suggested initial operating standard: assign during staffed hours within 15 minutes; no hot lead without a next action; review overdue follow-ups daily. These are proposed internal standards, not researched industry averages. Validate the six unassigned records before routing; do not infer the other 5,695 are being followed up effectively.

7. Feature and solution benchmark

Benchmarks are selected for relevant capabilities, not claimed market leadership. Vendor pages describe availability; this review did not test paid accounts, negotiate prices or assess implementation cost. No comparable public conversion-rate benchmark was established, so no industry-average conversion target is invented.

Reference	Public capability	TaxPlan implication
ClearTax assisted filing [S10]	Earlier indexed description: income-complexity plans and expert handoff. Recheck returned 410 Gone.	Historical reference only; verify current offering before using for a purchase decision.
TaxBuddy GST [S11]	Dedicated expert, reminders, status reports and reconciliation.	Build recurring compliance value around visible pending work and expert ownership.
TaxBuddy assisted filing [S12]	Document review, expert assistance and post-filing support described by vendor.	Explain what happens after purchase and what support is included.
Zoho CRM [S13]	Criteria-based assignment for import, webform and API records.	Add reliable ownership and escalation to the existing CRM before considering migration.
Google GA4 [S6-S9]	Lead lifecycle events, purchase measurement and validation/filter controls.	Complete revenue and lifecycle measurement before expanding dashboard features.

TaxPlan already publicly advertises consultations, topic selection, scheduling, expert choice, document upload and a written summary, plus a callback form [S14]. Its homepage lists multiple service families and calculators [S15]. Therefore, the recommendation is to verify and improve completion of these existing journeys, not assume they are absent and rebuild them.

Recommended feature order:

- First: a shared lead-to-payment record, source attribution, required owner/next action, delivery logs and reconciled revenue.
- Next: calculator-result-to-relevant-expert handoff; short qualification form; retain context through login; display price scope and service steps.
- Then: client status tracker covering documents pending, expert review, payment, filing and completion; consented reminders with stop rules after completion.
- Later: recurring compliance calendar and renewal reminders; analyse actual customer recurrence before building subscriptions or a new mobile app.

Build versus buy: retain the current CRM if it can provide stable IDs, stage history, secure webhooks, assignment and auditability. Pilot a mature CRM only if those capabilities cannot be delivered reliably. Compare total ownership cost, data migration, permissions, payment integrations and staff adoption. The screenshots do not justify purchasing or migrating to a specific vendor today.

Tax content quality should be a product capability: every calculator needs an effective year, authoritative source, named review owner, review date and regression cases. This has higher priority than adding more calculators or an unverified AI advisory layer.

8. Delivery roadmap and acceptance gates

Timing is proposed relative to team start, not a promise that work has been deployed. Owners are roles to assign internally. Dependencies include access to the website, CRM, GA4, payment records and campaign exports.

When / owner	Deliverable	Completion gate
Days 1-3: analytics + finance	KPI dictionary and matched-period lead/payment reconciliation	CRM wins, orders and collected revenue have explicit definitions; exceptions listed.
Days 1-3: tax owner + engineering	Partnership-calculator accuracy review	Year-labelled copy and calculations pass approved historical/current-year fixtures.
Days 1-7: engineering + analytics	Lifecycle, purchase and refund instrumentation	Positive, negative, retry and consent cases pass; no personal data in analytics.
Days 3-7: analytics	Development/staff separation and tag registry	Test traffic verified separately; filter evidence reviewed before activation.
Week 2: sales operations	Ownership, next actions, loss reasons and daily queues	No eligible hot lead lacks an owner/next action; exceptions visible.
Weeks 2-4: marketing + product	Weak-campaign diagnosis and calculator handoff experiment	Decisions use accepted/qualified leads and net value, not clicks alone.
Weeks 4-8: product + service team	Client status, document reminders and recurring-service pilot	Service completion/renewal tracked with consent and stop rules.

Release gate: all controlled test payments reconcile exactly with the finance test ledger, with zero duplicates. For real traffic, measure consent eligibility, blockers and delivery failures separately; GA4 is not expected to equal the entire financial ledger. Proposed monitoring threshold: at least 95% delivery among eligible instrumented events, with an exception queue for the remainder.

Historical data must remain labelled as pre-repair. New filters and events generally do not repair old reports automatically. Record deployment dates and compare only clean, comparable windows.

Campaign review sequence: map the ID to the ad account; confirm destination and tracking; inspect device/placement/geography; compare accepted and qualified leads; include spend and net collected value; then keep, modify or pause according to a pre-agreed commercial threshold. No campaigns were changed in this review.

9. Management dashboard and experiments

Replace the top-level emphasis on all-event counts and a 100% web donut with a business funnel. The web donut means platform composition, not that every visitor converted.

Management measure	Definition / source
Accepted leads	Unique valid CRM enquiries created in period; exclude agreed test/duplicate records
Qualified lead rate	Qualified leads / accepted leads from the same matured creation cohort
Customer conversion	Paid customers / accepted leads from the same matured cohort
Net collected revenue	Verified receipts less refunds under an explicit tax policy
CAC	Allocated acquisition spend / new paid customers on a matched attribution basis
ROAS	Attributed revenue / ad spend; report separately from margin
Contribution after acquisition	Revenue less refunds, variable service/payment costs and acquisition spend
Operational health	Median and 90th-percentile first-contact time, overdue leads, documents pending
Measurement health	Eligible-event delivery, duplicates, unmatched orders, missing source fields

Always show date, timezone, attribution model, consent coverage, customer/staff scope and data freshness. Keep first-user acquisition, session acquisition and financial attribution in distinct views. Revenue allocation must not count the same order in full under several channels.

Experiment A: on the partnership result page, compare a generic consultation link with a service-specific expert-review action. Primary outcome: qualified leads per eligible calculator visitor. Guardrails: completion rate, mobile performance, lead quality and complaints. Review tax accuracy first.

Experiment B: compare a dedicated paid-social service page with the current destination, preserving the same audience and offer where feasible. Primary outcome: cost per qualified lead, then paid-customer contribution. Investigate the weakest campaign before increasing its budget.

Experiment C: introduce a clear document checklist and visible next step after a lead is accepted. Primary outcome: proportion completing required documents and becoming paid customers within a defined service window. Guardrails: opt-outs, support load and errors.

Predefine the eligible population, minimum detectable improvement and sample requirement once the clean baseline is known. Run across a full relevant business cycle. If volume is too low for a powered split test, use staged rollout and qualitative observation, clearly labelled as directional evidence. Do not declare a winner from a handful of conversions.

For seasonal services, evaluate customer return at the next relevant filing cycle. For GST or recurring compliance, use completion and renewal by monthly/quarterly service cohort. The observed weekly retention card cannot substitute for either measure.

10. Evidence ledger and calculation audit

Screenshot references use exact date/time stems from the supplied filenames. They are evidence references, not links to live account data.

Evidence group	Screenshot stems	Used for
Exact audience and channels	2026-10-28 094359, 094552, 095017, 095039, 095121, 095132, 095229, 095411	Counts, engagement, first-user medium
Campaigns	2026-10-28 093858, 093909, 094129	Matching sessions and engaged sessions
Manual source/medium	2026-10-28 093250, 093308, 093347, 093409	Source, development labels and medium diagnostics
Missing dimensions/outcomes	2026-10-28 091628, 093331, 093828, 093841, 093947, 094001, 094018	Empty revenue/platform and lead metrics
Search	2026-10-28 091835, 091922, 092143, 092229, 092327, 092443, 093120, 093142	Clicks, impressions, position, URL/report issues
Trends	2026-10-28 094235, 094312, 094453, 094530, 095109, 095211	Daily/monthly shape only; no exact inferred monthly totals
Retention	2026-10-27 154957, 155107, 155131	Cohort values and maturity caveat
CRM	2026-10-27 101535	Pipeline counts; clipped paid revenue
Earlier baseline	2026-10-26 185235 through 185403; 2026-10-27 154813	Separate short-period context

Key arithmetic: 93/5701 = 1.6313%; 924/8916 = 10.3634%; 16136/8916 = 1.8098; (121+111)/16136 = 1.4378%; 84/323 = 26.0062%; 177/226 = 78.3186%; 466/22000 = 2.1182%; 86/7300 = 1.1781%.

Important non-additivity: channel rows sum above the total; new and returning users overlap; first-user and session dimensions describe different attribution scopes; K-rounded rows lose precision; screenshot date ranges differ. Ratios in this report never convert those separate views into an invented end-to-end funnel.

Not established: exact lost revenue, historical customer acquisition cost, current advertising waste, cause of June/October spikes, actual calculator outputs, competitor conversion rates, and whether admin traffic reflects staff or legitimate clients. The repair plan specifies how the internal team can resolve these unknowns without another screenshot-only guess.

Prepared for decision-making and implementation planning. Live changes require the TaxPlan team's execution and verification. The business analysis is based on supplied screenshots, not an audit of underlying accounts or transactions.

12. International benchmark: scope and decisions

Research expansion, 28 October 2026. Seven markets examined: India, United States, United Kingdom, Canada, Australia, Singapore and Germany. The aim is to identify transferable solutions to TaxPlan's observed problems. This is a selected-market feature benchmark, not a census of all providers or every possible fix.

Evidence standard: official product/help pages establish advertised capabilities; they do not prove implementation quality or conversion uplift. Recommendations below are analytical inferences. No competitor account was purchased or tested. An unobserved TaxPlan feature is marked for verification rather than assumed absent. Foreign tax-authority integrations, filing rules and guarantees cannot simply be copied into India.

Market / reference	Verified public pattern	Useful adaptation for TaxPlan
India: TaxBuddy [G1]	Expert-supported GST, reminders and status reporting	Named service owner, pending-document view and filing calendar for recurring clients
US: TurboTax Full Service [G2]	Match an expert to the tax situation; upload documents; review with expert	Short service triage, suitable expert assignment and review checkpoint
UK: Taxfix, formerly TaxScouts [G3]	Filing/support tiers, accountant messaging and year-round support in higher tiers	Distinguish filing-only, filing plus advice, and recurring support with explicit scope
Canada: Wealthsimple Tax [G4]	Situation questions, permitted document autofill, review/error resolution and submission confirmation	Reuse verified data, show unresolved issues and retain an acknowledgement after filing
Australia: H&R Block [G5]	Four-question entry, matched consultant, document portal and approval before lodgement	Progressive intake, mobile upload and explicit approval trail
Singapore: Osome [G6]	Accounting/compliance bundle, reports, bank connections and review/advice tiers	Pilot recurring GST/accounting support for suitable business clients
Germany: Taxfix [G7]	Personal document task list, notes, chat and status updates	One client workspace with outstanding items and a visible next action

TaxScouts has rebranded to Taxfix in the UK; treat it as one service, not two independent competitors. Taxfix's UK and German offerings are country-specific implementations of the same group, not independent evidence of market-wide results.

Source freshness correction: the earlier ClearTax assisted-filing URL returned 410 Gone during this expansion. The earlier indexed description remains historical context only. Do not rely on it for current availability, pricing or a procurement decision without a new verified source.

The strongest common product lesson is continuity: a client should know which service they selected, who owns it, which documents are missing and what happens next. This is more immediately useful than expanding the number of calculators or creating a new mobile app.

13. Features worth adopting and how to measure them

Each proposal is tied to a business problem. Existing TaxPlan consultation, expert-choice and upload capabilities should be inspected and improved before creating replacements. Priority is a recommendation, not evidence that the feature is missing.

Proposed feature	Evidence / problem	Minimum useful version	Success measure
Progressive service triage	Weak paid engagement; H&R Block / TurboTax [G2,G5]	Ask service, income situation, year and preferred contact; defer detailed paperwork	Accepted and qualified leads per eligible visitor
Expert routing and continuity	Six CRM leads unassigned; international matching patterns	Named owner by skill/availability, fallback queue and reassignment history	Unassigned ageing; first-contact time; completed services
Document readiness checklist	German Taxfix / Canadian review flow [G4,G7]	Required, received, rejected and approved states; clear correction requests	Time to complete documents; repeat requests per case
Client case tracker	TaxBuddy / Taxfix / Osome [G1,G6,G7]	Stage, owner, next action, due date and receipt; show reasons for delay	Completion time; status-related support contacts
Filing approval checkpoint	H&R Block / Wealthsimple [G4,G5]	Versioned summary, client approval, timestamp and final acknowledgement	Cases filed with correct approval and receipt
Tiered service scope	UK Taxfix [G3]	Clear inclusions, exclusions, support window and escalation route	Paid conversion, service margin, disputes and refund rate
Recurring compliance workspace	Singapore Osome / India TaxBuddy [G1,G6]	One recurring service type, due-date reminders and monthly status	Renewal, on-time completion and contribution margin
Context-preserving calculator handoff	Visible search demand; existing consultation flow	Carry selected service and year into enquiry/login with user permission	Result-to-qualified-lead rate; calculator completion

Expected mechanisms, not promised outcomes: shorter intake may reduce abandonment; document readiness may reduce consultant rework; status visibility may reduce repeated support queries; recurring support may improve repeat revenue. Measure each effect rather than quoting a competitor's marketing claim as a forecast.

Implementation detail that matters to the client: tell them why information is needed, allow save-and-resume, and confirm what was received. Do not require a full tax document set merely to request a callback. Conversely, do not promise a filing turnaround until the required documents and expert capacity are available.

Country adaptation rules: use the Canadian autofill example as a data-reuse pattern only; Indian data access requires its own authorised integrations and consent. Use US/Australian expert matching as workflow inspiration, not a claim that foreign professional credentials apply in India. Do not import foreign refund-payment mechanisms, filing extensions, guaranteed refunds or representation terms. Local tax and service owners must approve Indian equivalents.

Language and accessibility: test plain-language explanations and mobile document capture with actual users before funding broad translation or an app. Later evidence in sections 23 and 25 establishes a mobile-heavy funnel-entry population and browser-language rankings, but not which barriers materially affect paid conversion. A mobile website pilot and preferred-language question can establish need first.

14. New evidence: source, campaign and session quality

The fourth unique screenshot batch adds 20 images, bringing the evidence base to 80 unique supplied screenshots. Repeated resends of earlier batches are not counted again. These new views retain the 1 January-28 October 2026 scope where visible.

First-user source / medium	Total users	Engagement per active user	Engaged sessions per active user
google / organic	654	4m 49s	1.97
google / cpc	2,556	59s	0.73
ig / paid	376	3s	0.24
fb / paid	323	4s	0.27
ig / paid_social	228	58s	0.86
fb / paid_social	219	50s	0.69

Instagram's 58s versus 3s and Facebook's 50s versus 4s reinforce the need to inspect traffic cohorts. Changing the tag text will change reporting classification but will not itself improve real visitor quality. Compare campaign dates, placements, objectives, devices and landing pages before attributing the difference to tagging or creative quality. The ig/paid row also reports 378 new users against 376 total users; preserve this as another reconciliation exception.

First-user campaign 6977406146903 shows 312 total users, 0s displayed average engagement and 0.27 engaged sessions per active user. The earlier session-manual-campaign view showed 323 sessions and 84 engaged sessions. They support the same investigation priority, but must remain separate attribution scopes. A displayed 0s is rounded aggregate reporting, not proof that every visitor left instantly.

Other visible first-user campaign rows: BR- Instant Form - Lead Gen Campaign has 732 users and 1m 02s; BR | India | Search | ITR Filing | Leads has 518 and 1m 10s; 1000OFF_ITR has 343 and 50s; India's Tax Experts has 277 and 20s; TPA_ITR Filing has 202 and 1m 12s; ITR_Business_Search has 151 and 1m 14s. Campaign names suggest intent but do not verify platform type, native-form delivery or paid outcomes. Native ad-form leads, if used, require their own CRM ingestion; website sessions will not capture all of them.

Source-platform view: Unlabeled 3,690 users, Google Ads 2,509, Manual 2,259, Meta Ads 537 and Other Ads 36. This populated view differs from the earlier empty manual-source-platform cards. Manual is not automatically an error, and Unlabeled is not identical to Direct. First-user Google Ads network/ad-group '(not set)' values include users outside the scope of Google Ads; do not call the 72.16% network or 89.13% ad-group '(not set)' shares tracking-loss rates. Validate missing data within an appropriately filtered Google Ads population [G15,G16].

15. New evidence: session funnel and anomaly checks

Exact session totals now available: 16,136 sessions, 10,612 engaged sessions, 65.77% engagement rate, 1m 21s engagement per session and 12.22 events per session. These are distinct from 4m 01s average session duration and 2m 27s engagement per active user elsewhere in the report.

Session channel	Sessions	Engaged sessions	Engagement rate	Engagement / session
Direct	7,471	5,231	70.02%	1m 12s
Organic Search	3,173	2,143	67.54%	1m 43s
Cross-network	1,750	1,166	66.63%	52s
Paid Social	1,289	551	42.75%	21s
Paid Search	1,122	751	66.93%	58s
Organic Social	525	396	75.43%	1m 59s
Referral	448	322	71.88%	4m 57s
Unassigned	206	5	2.43%	2m 19s
AI Assistant	56	35	62.50%	7m 50s
Paid Other	52	28	53.85%	33s

Paid Social is 24.79 percentage points below Organic Search on session engagement. Organic Social and Referral show stronger engagement rates than Organic Search, so 'organic search is strongest' must be restricted to the major first-user-channel comparison in section 2. It is not a universal ranking across every metric. Small channels and internal activity can distort averages; qualified customers and margin remain the deciding measures.

The ten visible session rows sum to 16,092 sessions and 10,628 engaged sessions. The session sum is 44 below the displayed total; the engaged-session sum is 16 above its displayed total. The report indicates 11 rows, but the missing row's label cannot be identified. Do not invent a missing engaged-session count or force these aggregates to reconcile; check the export and report aggregation settings.

Unassigned is 206/16,136 = 1.28% of sessions, but only 5/206 are engaged. Its 2m 19s average engagement alongside 2.43% engagement warrants checking session association and event timing, not simply concluding low-quality traffic. Inspect session_start/page_view coverage, supported server-event identifiers, engagement parameters and custom channel rules. Google identifies missing session_start as one cause of '(not set)' session attribution; this does not establish the root cause here [G15].

The 15 October AI insight reports Direct 307 versus expected 10, while its detail card says 18 to 310 and Chrome 16 to 281. Preserve these inconsistent labels; they are diagnostic prompts, not verified transaction evidence. Proposed investigation: compare hourly event exports with campaign launches, release/QA logs and server requests; inspect entry pages, hostname, consent, geography and client/session patterns; then check accepted leads and payments. Annotate confirmed causes. Do not delete traffic or claim an attack on the basis of this card.

Google Ads network detail shows Cross-network 1,527 users, Google search 885, Search partners 48 and Display 11. Small samples preclude blanket network exclusions. Ad-group names such as 'Ad group 1' are weak management labels; use stable IDs plus service/intent names. The presence of 'Performance Max' in an ad-group label does not by itself verify the campaign configuration.

16. Fix alternatives: measurement and reporting

This expands the issue register with practical alternatives. Effort bands are planning estimates after access and discovery: S = roughly 1-3 person-days, M = 4-10, L = more than 10. They exclude procurement, vendor approval, legal review and waiting for data maturity; they are not quotes or guaranteed delivery dates.

Issue	Low-complexity option	Integrated option	Recommendation and gate
CRM wins absent in GA4	Matched-period CRM/order reconciliation, S	CRM stage webhooks to GA4 plus delivery log, M-L	Start ledger now; automate controlled lifecycle events; no duplicate test leads
Revenue missing	Finance export joined to campaign/lead IDs, S-M	Verified gateway events to order ledger and analytics, M-L	Payment ledger is source of truth; successful/failed/refund/retry cases reconcile
Attribution fragments	Tag registry and reporting lookup, S	Preserve click IDs and campaign IDs in CRM; approved ad-platform outcome import, M-L	Keep raw history; validate one complete consented journey
Ad bidding lacks outcomes	Review matched qualified-lead cohorts manually, S	Google Ads enhanced conversions for leads using supported integration, M-L	Import genuine outcomes; verify diagnostics and count settings before bidding changes
Development/admin activity	Staff/customer reporting segment, S	Separate test collection and production-host checks, M	Test eligibility before permanent filters; preserve real customer journeys
Empty optional dimension	Replace card with populated source/medium/platform view, S	Add manual platform tagging where useful, S-M	Use populated First user source platform view; do not add tags just to fill a card
Unassigned / missing scope	Filter and inspect affected sessions, S	Fix collection order, session IDs or mapping only where evidence proves defect, M	Reproduce issue and verify sessions across consent/reload/server-event cases
fbclid / duplicate URLs	Normalised reporting path, S	Canonical/sitemap/redirect fixes for confirmed duplicate pages, M	Preserve functional parameters and attribution; verify chosen canonical

Measurement architecture choice: a secure reconciled export is sufficient for an initial small-volume review. A lightweight scheduled CRM/payment join adds repeatability. A warehouse becomes useful when history, multiple touchpoints, services or refunds exceed what the simpler approach can reliably handle. A customer-data platform or complex attribution system is not a prerequisite for repairing the visible gaps.

Google Ads outcome import addresses ad optimisation; GA4 lifecycle events address analytics. They are separate integrations. Official guidance recommends enhanced conversions for leads and describes supported Data Manager paths [G8]. Verify current account eligibility and connector/API support. Do not send ordinary email/phone fields to GA4; any permitted hashed matching data belongs in the supported advertising workflow with appropriate consent and controls. Avoid counting both imported and GA4-derived copies of the same sale as primary bidding outcomes.

Razorpay documentation describes signature checks, duplicate delivery and event-order considerations [G9]. If TaxPlan uses another gateway, apply that provider's documented equivalents. No gateway is assumed from screenshots. A 'payment success' browser page alone is insufficient authority to recognise collected revenue. Reconcile verified order/payment states, refunds and settlement exceptions.

Canonicalisation and reporting normalisation solve different problems. Google documents redirects, canonical annotations and sitemaps as signals [G10]. Changing GA4 grouping alone does not alter search indexing; adding a canonical alone does not consolidate historical analytics rows. Inspect both before selecting the remedy.

17. Fix alternatives: acquisition and service delivery

Issue	Practical alternatives	Preferred first action / effort	Verification
Weak paid / paid_social cohorts	Improve destination; adjust audience/placement; change objective; cap/pause a proven weak cohort	Map source and campaign to actual landing page and lead cohort, S-M	Compare qualified-lead cost and contribution after adequate maturity
Possible mobile journey friction	Fix measured performance; shorten intake; defer login; preserve state	Mobile walkthrough and field-performance check, S-M	Completion and qualified leads improve without errors or quality loss
Search impressions with low CTR	Better intent-aligned title/snippet; content refresh; expert CTA; consolidate duplicates	Verify calculator rules, then query/page optimisation, M	Exact matched query CTR and qualified-lead rate, not sitewide CTR alone
Calculator accuracy concern	Correct dated copy; version rule table; block unverified current-year output; independent engine review	Tax-owner validation of affected years, S-M; engine work may be L	Boundary, loss, year-switch and regression cases pass signed review
No owner / overdue leads	Daily manual queue; CRM assignment rules; availability/skill routing	Owner and next action required, S; rules M	Eligible cases routed once; fallback and overdue escalation work
Missing loss reasons	Small controlled reason list; stage-exit validation; periodic call review	Add required reason with an explicit unknown category, S-M	Losses are explainable; staff cannot fabricate a reason to close a record
Fragmented client communication	Existing portal improvements; practice-management portal; custom workspace	Pilot with one service and one team, M-L	Fewer repeated requests; higher completion; permission and export checks pass
Weak repeat engagement	Filing reminders; service-specific support; recurring compliance bundle	Separate annual-filing and recurring-service cohorts, S-M	Renewal/repeat purchase and net margin; stop messages after completion/opt-out
June/October traffic anomalies	Campaign/release annotation; logging audit; invalid-traffic investigation	Preserve evidence and isolate dates first, S	Cause supported by events/logs; corrections do not suppress legitimate clients

For performance diagnosis, measure real-user LCP, INP and CLS where data is available; Google's 'good' reference thresholds are LCP at most 2.5 seconds, INP at most 200 milliseconds and CLS at most 0.1, evaluated at the 75th percentile [G11]. These are technical experience thresholds, not universal sales-conversion targets. The screenshots do not demonstrate a Core Web Vitals failure.

Use structured usability observation first. If replay/heatmap software is selected, pilot on public marketing pages with consent and deliberate masking; exclude tax documents, payment details, account pages and sensitive URLs. Microsoft documents masking controls and that changes do not fix old recordings [G12]. Replay is optional and should answer a specific abandonment question.

A practice-management portal is an alternative to custom development, not an automatic purchase recommendation. TaxDome documents request fields, file uploads and reminders [G13,G14]. Test Indian service fit, data handling, permissions, client effort, exportability and recurring cost. An existing TaxPlan portal may already meet the need with smaller changes.

Commercial limits: do not launch discounts or guarantees solely because competitors advertise them. Define service scope, consultant capacity, refund terms and contribution margin first. In particular, '50% OFF' and '1000OFF' campaign labels do not establish the actual price paid or justify copying the offer.

18. Priority shortlist and delivery economics

Recommended order combines the screenshots with the international workflow research. It is not a claim that every item will increase revenue.

Sequence	Deliverable / owner	Why now	Main dependency
1	Matched lead/order/revenue ledger; finance + analytics	Establish whether sales and reporting agree	CRM and payment exports, definitions and dates
2	Review calculator years; tax owner + engineering	Protect useful existing search demand	Authoritative rules and approved fixtures
3	Investigate ig/paid, fb/paid, campaign 6977406146903 and Unassigned; marketing + analytics	Clear observed quality differences and collection questions	Campaign IDs, destinations, event/session data
4	Owner, next action, loss reason and routing; sales operations	Prevent avoidable operational leakage	Agreed service stages and staffed capacity
5	Short intake and context-preserving expert handoff; product	Adapt international matching/intake patterns	Reliable lead acceptance and outcome measures
6	Document checklist, status and approval; service team	Reduce follow-up friction and uncertainty	Defined case workflow and access model
7	One recurring compliance pilot; service + finance	Test recurring value rather than assume it	Successful delivery and service-level margin

Build/configure/buy decision: prefer configuration if the current product supports stable IDs, required fields, routing and audit history. Use a managed connector if it supports the exact event semantics, retries, consent and exports. Build the missing integration when those contracts cannot be met. Consider replacing the CRM only when the current system cannot meet essential requirements at a reasonable total cost.

Compare options using a twelve-month ownership model: implementation labour + licences + integration/hosting + migration/training + ongoing maintenance. Obtain vendor quotes and internal rates; no reliable INR estimate is possible from screenshots alone. Feature availability may depend on plan, region or contract.

Commercial acceptance: customer contribution before acquisition = service revenue less tax treated as pass-through, refunds, variable professional-delivery cost and payment cost. Break-even acquisition cost cannot exceed that contribution without explicitly justified future value. Estimate future value from actual renewal cohorts, not competitor claims. Where margins are unknown, prefer reversible pilots with capped spend and a stated decision date.

What to defer: new native apps, broad international expansion, large-scale CRM migration, algorithmic lead scoring and additional AI tax advice. Their value is not established by this evidence. Better outcome measurement, reliable service completion and calculator trust come first.

Decision log for every trial: issue ID; evidence; chosen alternative; rejected alternatives and reason; owner; start date; population; cost cap; success and stop rules; review date; observed result. This makes future report updates concrete and prevents proposed fixes from being mistaken for deployed improvements.

19. Expanded evidence and research references

New screenshot ledger: 2026-10-28 095837 (source/medium trend); 095851 and 095902 (source/medium rows); 095928 and 095941 (platform); 100111, 100126 and 100135 (campaign); 100204 and 100226 (Google Ads network); 100810 and 100821 (ad groups); 100853 and 101505 (AI anomaly cards); 100912 and 101519 (session trend); 100950, 101024, 101530 and 101540 (session-channel tables). Repeated views are corroboration, not extra observations.

Additional arithmetic: 10,612/16,136 = 65.77%; 67.54%-42.75% = 24.79 percentage points; visible session rows sum to 16,092 and engaged rows to 10,628. Sessions are 44 below the total, while engaged sessions are 16 above it. The 206 Unassigned sessions have 5 engaged sessions (2.43%). Source-platform and user counts are displayed as supplied; do not force them into an additive partition.

Official sources checked on 28 October 2026. Feature descriptions are bounded by the specific country/product page. No conversion uplift, cost saving or competitor outcome is independently validated.

Expanded coverage: the report now includes seven-market workflow benchmarking, alternatives for every issue family identified in this review, relative implementation effort, dependencies and acceptance gates. It does not establish every possible root cause or solution. Actual production fixes, account audits and vendor selection remain for the authorised TaxPlan team, since only screenshots and public information were available.

20. Lead acquisition: revised commercial interpretation

Update incorporating the five further batches received after the 80-image edition. The full review now covers 176 distinct screenshot files in nine batches. Several files show overlapping data; their values are not added together. The final sidebar-settings image is outside business scope. New findings below supersede any earlier uncertainty about whether initial GA4 leads are recorded.

GA4 records 73 new leads and zero qualified/converted leads. Google's New leads metric counts unique users triggering generate_lead, not raw submissions or necessarily unique CRM contacts [H1]. Initial lead measurement therefore exists, although its triggers, identity handling and business validity still need checking. The main lifecycle gap is after acquisition; zero reported outcomes cannot establish a zero real-world close rate.

First-user channel	New leads	Share of recorded new leads
Paid Search	39	53.42%
Paid Social	17	23.29%
Direct	11	15.07%
Organic Search	4	5.48%
Cross-network	1	1.37%
Referral	1	1.37%

Paid Search and Paid Social together account for 56/73 = 76.71% of recorded leads. This changes the commercial priority: preserve lead-producing activity while investigating quality and downstream outcomes. Organic Search's stronger engagement does not make it the largest lead source. Cross-network has substantial traffic but only one recorded lead in the channel view, which merits an objective/attribution review before additional investment.

Source/medium detail attributes 39 to google/cpc, 11 to Direct, 9 to fb/paid_social, 7 to ig/paid_social, 4 to google/organic, and one each to data-not-available, fb/paid and l.wl.co/referral. These visible rows also sum to 73. The platform view groups the same total as Google Ads 39, Meta Ads 17, Unlabeled 14 and Manual 3. These are alternative groupings, not extra leads.

The Google Ads network view shows Google search 39 and '(not set)' 34, with zero new leads displayed for Cross-network and Search partners. A nonzero user key event rate alongside zero new leads is possible because the selected metric includes other key events. Do not assume the network '(not set)' row means 34 lost Google Ads leads.

Ad-group lead counts are 19 for 'Ad group 1', 7 for ITR_50% OFF_Business_Search, 5 for TPA_Salary_ITR_Search_Aug, 4 for ITR_F&O_Search, 2 for TPA_Sale_On_Property_Search_Aug1, and one each for TPA_TAX_Search_Aug and the group labelled Performance Max. These sum to 39; '(not set)' adds 34 to reach 73. Obtain stable IDs before renaming or joining records; the campaign and ad-group scopes differ.

Do not adopt the displayed 6.59%, 6.82%, 6.58%, 7.26% or 6.61% user key event rates as lead-to-sale rates. They vary between views and are set to All events. Filter the exact business event and align dates, dimensions and eligible users. Compare the 73 recorded lead-users with accepted CRM enquiries by identity and time; do not divide 93 CRM wins by these 73 to produce a close rate.

21. Session sources and campaign-cost import repair

New session source/medium rows confirm that the poor 'paid' cohort is not just a first-user reporting effect. Engagement time below is per session, unlike the per-active-user measure in section 14.

Session source / medium	Sessions	Engaged	Engagement rate	Time / session
google / organic	2,969	2,006	67.56%	1m 42s
google / cpc	2,815	1,873	66.54%	55s
ig / paid	394	88	22.34%	2s
fb / paid	330	85	25.76%	3s
ig / paid_social	260	195	75.00%	50s
fb / paid_social	255	149	58.43%	43s
(not set)	201	0	0.00%	2m 22s
bing / organic	145	95	65.52%	2m 04s
localhost:8080 / referral	121	81	66.94%	1m 07s

The ig/paid_social rate is 52.66 percentage points above ig/paid; the Facebook difference is 32.67 points. Compare the actual ad cohorts, dates and destinations, not just the labels. The 201 '(not set)' sessions with zero engagement and positive average time sharpen the session-association investigation. They may contribute to Unassigned, but an event-level join is needed to confirm overlap; never add them to the earlier 206 Unassigned as separate cases.

Session source platform is populated: Unlabeled 6,588; Manual 6,043; Google Ads 2,767; Meta Ads 625; a blank-label row 49; Other Ads 37. The blank row is observed as blank; it must not be renamed '(not set)' without verification. These rows sum to 16,109, not the 16,136 total; their engaged counts sum to 10,631 versus 10,612. Preserve the discrepancies and inspect exports, processing state and aggregation before reconciling.

The filtered campaign-import validation report shows coverage 0/12, 8,688 events, 73 key events, zero imported clicks/impressions/cost, and 'No Campaign data' on the visible pairs. This establishes no joined campaign data in that displayed scope. It does not establish that the business spent zero, that all account integrations are absent, or that these 73 key events equal the 73 unique new lead-users.

Repair choices: (1) join platform spend exports to CRM outcomes outside GA4 for a controlled first reconciliation; (2) use a supported direct campaign import if its mapping supports the account's tags; (3) use a prepared daily CSV/Sheets/warehouse feed when historical variants require explicit mapping. Google's documentation identifies source, medium and date as required keys, currency when cost is included, and campaign ID/name as useful matching fields [H2].

For this account, preserve raw ig/fb/meta/an and paid/paid_social labels. Build a mapping to actual campaign and placement IDs; do not assume 'an' is a verified placement. Never copy the same campaign spend in full onto several source aliases. Allocate only with defensible platform detail, or report at a coarser reconciled level. Check account timezone, currency, date, case and campaign identifiers. Pilot one campaign/day; compare imported, matched and unmatched amounts, then scale. Cost joining and qualified-lead import solve separate problems.

22. Landing pages: intent, missing entries and staff use

The landing-page view reports 16,136 sessions, 8,911 active users, 8,859 new users, 4,156 key events and INR 0 revenue. These key events include All events and are not 4,156 customers. Landing-page session values describe the entry page; page-path view counts later in this report describe browsing throughout a visit. They cannot be used interchangeably.

Landing page	Sessions	Share	Key events, all types	Engagement / session
Homepage /	8,477	52.53%	2,940	1m 17s
ITR filing service	1,552	9.62%	144	59s
(not set)	938	5.81%	26	45s
/dashboard	868	5.38%	91	1m 01s
/login	706	4.38%	98	1m 25s
GST returns service	683	4.23%	301	1m 04s
/whatsapp-admin	328	2.03%	228	7m 12s
/signup	260	1.61%	3	25s
/profile	154	0.95%	5	1m 36s
Registration services	146	0.90%	5	19s

The homepage is the largest entry point, so service routing there deserves attention. Preserve a returning-client sign-in route while making the relevant enquiry action clear for new prospects. Test a relevant service landing page for paid campaigns rather than assuming every campaign should land on the homepage.

938 '(not set)' landing sessions is a larger concern than the earlier 201 source '(not set)' sessions. The two populations may overlap; they measure different missing fields. Google's existing guidance [G15] identifies missing page_view as one cause of an unset landing page. Inspect first event, route changes, consent transitions and server-event session association. Do not invent a literal '(not set)' webpage or redirect it.

The admin entry has 328 sessions from only 21 active users, 228 key events and lengthy engagement. This is a high-priority staff-role segmentation check, not automatic proof of contamination or a security exposure. Use authenticated roles to classify staff/admin activity, keep access control independent of analytics, and inspect whether administrative actions are marked as marketing key events. Login/profile activity can also belong to real customers or consultants; retain operational reporting separately.

The 15 October landing-page AI card says 270 homepage sessions against expected 20; its India detail says 21 to 272 and Direct detail 6 to 216. Page-view AI cards separately report 812 homepage views against expected 31, Chrome 38 to 744 and Google-device views 27 to 591. These are different metrics/windows with AI-generated explanations. Use them to locate an investigation, not to prove acquisition success, device fraud or a causal campaign.

Acceptance: a clean visit starts with a correctly associated page_view; accepted lead, service choice and payment can be attributed to that visit when consent permits. Staff, customer and consultant roles have explicit reporting treatment. A campaign/landing-page table shows unique accepted leads and paid outcomes, not all-key-event counts as a proxy.

23. Ecommerce: distinguish absent measurement from abandonment

The sales screens show INR 0 total/ecommerce revenue, zero purchasers and first-time purchasers, no purchased items, no transaction IDs and no promotion data. Acquisition-cohort tables show zero transactions and INR 0 average 120-day value across the displayed channels/sources/campaigns. These extend the evidence for missing or unrecorded commercial outcomes; they do not prove no customer paid outside GA4.

The purchase journey records 8,697 users at session start and zero at view product, cart, checkout and purchase. Its open-funnel toggle is on. The checkout journey has no observed checkout entrants; a 100% label on its first step is a funnel convention, not evidence of checkout starts. Both screenshots display warning icons whose details were not opened. Do not interpret these screens as verified 100% business abandonment.

Google's standard purchase journey depends on specific ecommerce events such as view_item, add_to_cart, begin_checkout and purchase [H3]. A tax-service business may legitimately accept a consultation or enquiry without a cart or shipping step. Select the report to fit the real journey; do not invent carts or shipping events merely to populate the template.

Commercial route	Appropriate measurement	Acceptance test
Consultation / assisted enquiry	Service view, accepted enquiry, contact, qualification, quote, paid order and completion	One accepted case follows lifecycle without counting a click as a sale
Direct online service purchase	Real service selection and checkout events, verified purchase and refund	Successful and failed payments, redirects and webhook retries reconcile
WhatsApp / phone payment	CRM-originated order and confirmed receipt; compatible analytics/ad linkage if available	Payment linked to internal lead/order; no invented historical web session
Recurring compliance	Renewal order, service period and refund/cancellation handling	Each real renewal has one payment record and an explicit service period

Use a stable service catalogue for item_id/item_name, service category and applicable year, without placing personal tax information in analytics. Capture coupon only when actually applied. Empty coupon/list/promotion cards can be normal if those features are unused. Purchase and refund should reconcile to a financial ledger; customer conversion, contract value and money collected are separate states.

Average 120-day value concerns recorded revenue over an early user-lifetime window [H4]. It is not an estimate of all future customer value. With no recorded transactions, its zero value cannot justify a zero-CAC target or prove the product has no lifetime value. After instrumentation, assess mature cohorts and retain a separately reconciled CRM/finance view of value.

Mobile priority is now supported by the purchase-journey entry population: 6,623 mobile users (76.15% of 8,697), 2,065 desktop, 27 tablet and 9 smart-TV users. Their sum is 8,724, exceeding the unique total by 27; users can appear on more than one device, and this is not a device-session share. Prioritise real mobile-browser tests of service choice, login, upload and payment return. The earlier uncertainty about device mix is superseded for this measured population, while device-specific conversion performance remains unknown.

24. Event quality, forms and page identity

The latest event report records 197,221 events across 8,917 total users; page reports show 8,912 active users. Earlier screenshots show 197,215 events and 8,916 total users. Preserve these capture-specific values: small changes during a live reporting day are not by themselves evidence of a tracking defect.

Event	Event count	Users shown for event	Interpretation
page_view	71,971	8,866	Page-view events, not unique people or sessions
scroll	20,302	4,014	Interaction measure; no sales implication
gtm.dom	20,290	3,412	Technical-looking event; inspect sender and purpose
user_engagement	18,109	6,092	Engagement events
session_start	16,043	8,842	Event count differs from the sessions metric
analytics	11,807	3,515	Ambiguous custom name; inspect payload and trigger
web_vitals	9,742	1,290	Performance events exist; inspect actual values
first_visit	8,860	8,813	Event/identity measure, not new customers
form_start	7,056	1,313	May include different form types
form_submit	6,688	508	13.17 submissions per event-user; not verified leads

Recorded form_submit is not the same contract as accepted generate_lead [H1,H5]. Audit enquiry, login, signup, calculator and admin forms separately. Compare form ID, page, backend result, role and repetition. Candidate explanations include legitimate repeat use, multiple form types, retries, duplicate listeners or broad triggers. The screenshot alone cannot choose the cause.

Do not present 6,688/7,056 as a 94.8% lead-form completion rate: they are event counts across unverified form populations. Neither 508 submission-users nor 73 generate_lead-users is directly comparable to all 5,701 CRM records without matched scope, identity and dates. Validate a known enquiry from entry through server acceptance to one CRM ID and one generate_lead, and separately check rejected submissions and repeat attempts.

Audit event semantics and key-event configuration before adding more tags. Technical-looking names can reflect a catch-all event relay; verify rather than assume. Retain useful operational telemetry outside the acquisition scorecard. The existing web_vitals events mean the first performance step may be inspecting collected LCP/INP/CLS values, not installing another tracker. Test page_view once on initial load and once per intentional client-side navigation where applicable; do not count component rerenders as new page views.

Page totals are 71,971 views, 8.08 views per active user and 2m 27s engagement per active user. Repeated use is concentrated on /dashboard (7,894 views, 290 active users), /profile (3,601; 215), /vault (2,052; 144) and /my-earnings (1,622; 165). Their roles may include clients and consultants. Distinguish successful task completion from repeated work, refreshes and loops.

The top title has 21,367 views from 799 active users; a personalised-ecosystem title has 7,681 from 183 with 20m 34s engagement. These titles cannot be assumed to mean the same URL as /. Build a hostname + stable page-path + title + role mapping. Title changes and reused titles fragment reporting; they do not alone prove duplicate SEO pages. The /login page's 917 all-type key events in a page view and 98 in a landing view describe different attribution scopes, not interchangeable counts.

25. Audience, retention and local discovery

Country activity is led by India at about 8.1K active users, followed by the US 556, China 43, UAE 40, Ireland 28, Sweden 21 and Brazil 18. These are approximate/partial rows. Country presence does not establish residency, nationality, bot activity, customer demand or paid targeting. Test NRI-specific enquiries only against actual service eligibility and qualified demand; do not interpret foreign visits as permission to expand tax services abroad.

City activity is Hyderabad 625, Bengaluru 610, Mumbai 566, Ahmedabad 539, Pune 527, Delhi 501 and Indore 380. New-user and returning-user views have different rankings: Virar 115 and Vasai-Virar 106 lead the displayed returning cities. Evaluate serviceable enquiries, consultation scheduling and delivery capacity by city; do not create location pages that imply unverified physical offices.

Language charts show English predominating, Hindi second in active/new users, with smaller Gujarati, Chinese, Marathi, Bengali and Kannada rows. Language reflects browser/device settings [H6], not a confirmed preferred consultation language. The earlier absence of language evidence is superseded, but business need remains unproven. Start with plain English plus a preferred-language question and a measured Hindi-assistance pilot; fund full localisation only when completion and qualified demand justify it.

Stickiness shows DAU/MAU 0.5%, DAU/WAU 2.2% and WAU/MAU 22.7%. These are rolling activity ratios [H7], not percentages of paying customers retained. Account for the current partial day, annual filing seasonality and staff traffic. The 42-day engagement chart's near-zero tail is a reason to inspect cohort sizes and return behaviour; it does not establish revenue churn or failure of every customer to return.

Business Profile reports 376 interactions: 12 call actions, 48 website clicks and 316 direction requests. These sum to 376; the interaction mix is 3.19%, 12.77% and 84.04% respectively. Its screenshot date control is cropped, so do not silently compare its period with the annual GA4 period. Google defines Calls as clicks on the call button, not answered calls; directions do not establish office visits or sales [H8].

Local-service actions: verify accurate business details, services, opening hours and appointment route; tag the profile's website link consistently; record answered/missed enquiries and booked appointments in the CRM. Review whether directions match the business model and actual service location. Where appropriate, ask clients how they found the service without replacing measurable attribution. The empty 'menus' card is not a priority defect for a tax-services business.

Real-time acquisition cards show four active users in India at capture. This is a momentary operational snapshot, not a daily baseline or a growth result. The existing 100% Web platform card remains a platform-composition metric, not evidence of complete sales coverage.

26. Revised priorities and verification checklist

The new screenshots refine, rather than remove, the earlier priorities. The business has recorded leads and substantial mobile activity, but the financial and lifecycle connection remains unverified.

Priority	Concrete action	Alternatives / acceptance gate
P0: Lead-to-outcome gap	Verify the existing generate_lead trigger; join the 73 lead-users to eligible CRM cases; add qualified/closed outcomes	Start with a secure matched export; automate after semantics pass; no duplicate lifecycle events
P0: Commercial outcomes unrecorded	Map real enquiry-to-order and direct-payment routes	Custom service funnel or real ecommerce events as applicable; do not fabricate cart/shipping; ledger reconciles
P0: Cost not joined	Pilot import or external reconciliation for one campaign/day	Check mapping, dates, currency and duplicate allocation; displayed zero is not used as actual spend
P1: Key-event ambiguity	Audit which actions are marked key events, including staff/login and form events	Separate intent, accepted lead and commercial outcomes; future config changes labelled by date
P1: Form volume	Test each form type and success/retry path	Accepted enquiry generates one lead; invalid or administrative forms do not
P1: Missing attribution/page fields	Inspect 938 unset landing sessions, 201 unset source sessions and 49 blank-platform sessions	Evaluate overlap; replay consent/navigation/server-event cases; do not sum populations
P1: Mobile completion	Walk through enquiry, account access, document upload and payment on real phones	Use existing web_vitals data if valid; test errors and save/resume before app investment
P1: Paid-cohort quality	Compare paid and paid_social campaigns with CRM quality and spend	Preserve lead-producing campaigns; alter only cohorts supported by matched evidence
P2: Local and repeat value	Pilot profile appointment tracking and service-specific reminders	Measure booked/attended appointments and service-cycle renewal, not directions or daily activity alone

First review pack for the internal team: a KPI/event dictionary; one anonymised accepted enquiry traced to an order; matched spend and receipts for one campaign/day; a list of current key events; mobile failure observations; and an exception list of missing IDs/dates. These are implementation requirements for the authorised team, not requests for this chat to access their systems.

Decision gates remain: tax-owner sign-off on affected calculator years; no duplicates in controlled enquiry/payment/refund tests; transparent consent eligibility; successful production event delivery; finance/CRM reconciliation with documented exceptions. Do not use the latest screenshots to backfill invented historical orders or to conclude that zero tracked purchases means zero real revenue.

Recommended management view now has three explicitly separate layers: acquisition quality and source; accepted/qualified customer cases; and verified money/service delivery. Add mobile, role, geography and language cuts only where sample size supports decisions. A single blended 'conversion rate' cannot represent all three layers.

27. Additional evidence ledger and definitions

All 96 newly supplied files after the 80-image edition were inspected as attachments. Exact filename stems below are on 2026-10-28. Distinct filenames can show the same metrics; their counts are evidence coverage, not sample size. Repeated earlier uploads remain counted once.

New batch	Exact screenshot time stems	Coverage
5: 20 files	101600, 101618, 101631, 101642, 101704, 101715, 101726, 103305, 103323, 103342, 103401, 103418, 103438, 103458, 103510, 103544, 103602, 103612, 103719, 103728	Session sources/platforms, lead channels/source/platform/campaign/network, anomaly cards
6: 20 files	103752, 103847, 103956, 104011, 104023, 104033, 104243, 104305, 104315, 104342, 104355, 104403, 104422, 105048, 105116, 105127, 105152, 105211, 105231, 105301	Ad-group leads, landing pages, zero-revenue cohort views
7: 20 files	105312, 105548, 105603, 105613, 105626, 105704, 105723, 105806, 105820, 105852, 105903, 105919, 112130, 112145, 112156, 112210, 112228, 112242, 112251, 112306	Sales, ecommerce funnels, device mix, geography, engagement and event overview
8: 20 files	112316, 112331, 112342, 112356, 112457, 112508, 112523, 112533, 112544, 112620, 112631, 112641, 112727, 112835, 112853, 112904, 112913, 112942, 113004, 113021	Stickiness/language, page paths/titles, retention and event trends
9: 16 files	113042, 113058, 113138, 113153, 113204, 113230, 113242, 113252, 113314, 113338, 113415, 113427, 113511, 113525, 113541, 122855	Exact event counts, page corroboration, Business Profile, campaign-import validation, acquisition; final sidebar excluded

Definitions verified against official Google documentation on 28 October 2026. Cropped date controls and unopened warning details remain limitations. Small changes during capture are retained; historical attribution scopes are not forced into a single funnel.

Arithmetic checks: 39+17+11+4+1+1=73; paid share 56/73=76.71%; 75.00%-22.34%=52.66 percentage points; 58.43%-25.76%=32.67 points; 12+48+316=376; device rows sum to 8,724 versus 8,697 unique funnel entrants. These are descriptive results, not causal estimates or forecasts.

28. Cross-screenshot review: actions supported now

Second-pass review, 28 October 2026. All 176 referenced original files were located and indexed. Every image was visually revisited through 22 labelled review sheets; critical lead/event tables were also reopened individually. Four files show unrelated sidebar/disk interfaces; 172 show TaxPlan reporting or reporting controls. Overlapping views corroborate evidence, not additional customers. This is a screenshot-level review, not a transaction or implementation audit.

Sections 28-31 govern the confidence and execution conditions of earlier recommendations. Supported means the evidence justifies the stated next action, not that a root cause or business uplift has been proved.

Action / owner	Evidence compared	Final decision
Reconcile lead lifecycle / CRM + analytics	103323/103342: 73 lead-users and 0 qualified/converted; CRM 2026-10-27 101535: 93 wins	Keep reconciliation first. Align dates, eligible cases and identity. Do not calculate 93/73 or assume every CRM win should appear in this property.
Audit existing accepted-lead collection / engineering	Lead views record 73 users; 113042 records 6,688 form_submit events across 508 users	Verify the existing trigger. Do not add duplicate collection or treat all forms as enquiries. One person can create multiple legitimate cases; user counts and case counts are separate units.
Reconcile collected money / finance + engineering	CRM paid tile/WhatsApp count versus zero GA4 transactions, purchasers and revenue across sales/cohort views	Keep order/receipt reconciliation. Determine which payments should reach GA4 under consent and matching limits; do not claim the business has no revenue.
Reconcile campaign cost / marketing operations	113415/113427: 0/12 join coverage in a filtered report	Keep one-campaign/day import or external ledger pilot. Verify actual spend, mapping and currency. Zero displayed imported cost is not zero advertising spend.
Preserve commercially useful paid traffic / marketing + sales	103323: Paid Search 39 and Paid Social 17 lead-users; acquisition views show weaker engagement for some paid cohorts	Reject a blanket cut. Keep investigation and capped tests; use eligible qualified-case cost and collected contribution before deciding which cohort to scale or pause.
Test mobile journeys / product + engineering	105820: 6,623 mobile users in an 8,697-user funnel-entry population; 113042: existing web_vitals events	Keep phone walkthroughs and inspection of measured performance. No mobile conversion defect or need for a native app is proved.

The 73 lead-users recur across channel, source, platform, campaign and ad-group views. This supports the displayed total, not the business validity of each enquiry. Google defines New leads as unique users with generate_lead [H1, rechecked 28 October 2026]. Record accepted cases in the CRM separately; a universal one-user-to-one-case join would lose legitimate repeat service requests.

The paid share is descriptive: (39+17)/73 = 76.71%. It is not an incremental lift, close rate, profit share or reason to increase budgets before qualification and cost are reconciled. Organic Search's stronger engagement and four displayed lead-users justify improving its path to enquiry, not declaring it the most profitable channel.

29. Cross-screenshot review: conditional fixes and rejected readings

The following proposals survive only with a diagnostic gate. Do the check first; implement the corresponding change only when it identifies a defect or unmet customer need.

Candidate fix	Evidence and competing explanation	Required gate
Repair duplicate events/forms	6,688 submissions from 508 users; technical-looking event names	Inspect form type, role, backend acceptance and retries. Legitimate repeat operational forms are possible; remove duplication only when reproduced.
Remove internal/test activity from marketing	localhost referrers; /whatsapp-admin, dashboard, login and profile activity	Verify host and authenticated role. Referrers are not the collection hostname; clients and consultants can legitimately use account pages. Retain separate operational reporting.
Repair unset landing/source fields	938 unset landing sessions; 201 unset source sessions; 49 blank-platform sessions	Inspect each field's event sequence, session association and configuration. Do not add these overlapping counts or assume one universal cause.
Change ecommerce funnel	Lead/CRM activity exists while product/cart/checkout/purchase measurement is zero	Map the actual service journey. Use a custom enquiry-to-paid funnel or real checkout events. Reject confirmed 100% customer abandonment and fabricated cart/shipping events.
Repair SEO titles/URLs	Page-title and page-path totals differ; fbclid and functional parameters appear	Map hostname/path/title/year first. Reporting normalisation and search canonicalisation are separate actions; preserve functional parameters and attribution.
Change calculator rules	Retrieved rule text differs from researched amendment; no output tests supplied	Tax owner verifies year-specific law, explanatory copy and numerical fixtures. Correct affected text/logic only; do not replace historical constants indiscriminately.
Add routing, portal or reminders	Six unassigned CRM records; public TaxPlan features and international workflow examples	Inspect current functionality, ageing, ownership and service completion. Configure existing capabilities before replacement; measure actual bottlenecks.
Expand language/local/retention features	Browser-language ranks, local actions and rolling activity ratios	Pilot preferred-language support, appointments and service-cycle renewal. Reject inferred language preference, answered calls, office visits or financial churn from those charts alone.

Not supported by screenshots: blocking foreign countries, declaring a bot attack, claiming a new login-page launch, replacing the CRM, launching a native app, expanding into foreign tax jurisdictions, treating every '(not set)' Google Ads row as tracking loss, or buying a feature solely because a benchmark provider advertises it.

Seven-market benchmarking remains useful as a menu of workflow patterns. It does not establish competitor conversion rates, implementation quality, Indian integration permissions or guaranteed revenue improvements. Foreign country activity in GA4 is separate from the selection of countries for feature research.

30. Discrepancy register and what is actually resolved

These are reporting differences, not a list of confirmed implementation bugs. A known scope difference can explain why two figures should not be equated without explaining every numerical mismatch.

Comparison	What can be concluded now	Remaining verification
73 new lead-users versus 73 campaign-import key events	Different units and scopes; equal totals do not establish identity	Event-name breakdown and case-level linkage; never join the two merely by count
Cross-network: 1 channel lead versus 0 Google Ads network leads	Different dimensions; the report contains a real displayed difference	Same-window export with both dimensions and eligible IDs; no connector diagnosis from this alone
All-events key-event rates: 6.59%, 6.82%, 6.58%, 7.26%, 6.61%	Displayed rates vary while new-lead total remains 73	Inspect denominators, filters, event selection, processing and aggregation; do not invent a cause or use these as lead conversion rates
First-user versus session results	They attribute different things: initial acquisition versus individual sessions	Do not sum or divide them into an invented funnel; retain separate views
10 channel rows: 8,934 users versus 8,916 total	User rows cannot be assumed to form an additive partition	Check identity/aggregation and the unseen eleventh row; no invented correction
Session channel rows: 16,092 sessions and 10,628 engaged versus 16,136 and 10,612	Both displayed differences are retained, not silently reconciled	Complete export and report settings; do not assign a negative remainder to the unseen channel
Session platform rows: 16,109 and 10,631 engaged versus 16,136 and 10,612	A second displayed aggregation discrepancy exists	Same-date complete export; blank label remains blank pending inspection
8,724 device-row users versus 8,697 unique funnel entrants	Device rows may overlap users; the 76.15% value applies to that population	Identity and device aggregation; do not call it a share of all sessions
Landing versus page-path/title key events	Different reporting dimensions; login 98 versus 917 is not an interchangeable count	Trace the event and entry page separately; map titles to paths rather than assume they identify the same page

Smaller changes, including 197,215 to 197,221 events and 8,916 to 8,917 total users, can occur during a live reporting day. The cause of each change is not proved. Cropped date controls, partial-day processing and unopened warning details remain explicit limitations. CRM wins, short-period snapshots and Business Profile totals are not assigned the annual GA4 period without evidence.

Google Ads '(not set)' rows also contain people outside Google Ads. In the network lead view, 39 Google-search users plus 34 not-set users equals 73; this does not mean 34 Google leads were lost. Manual source-platform cards being empty is also compatible with a populated source-platform report: these are different fields.

References rechecked for this pass: H1, lead-report unique-user definitions; H2, campaign-import matching, currency and source/medium mapping. G15 could not be retrieved again in this pass; its earlier cited guidance is not newly verified. No research failure is represented as confirmation.

31. Final execution gates and acceptance record

All rows below have status NOT RUN against TaxPlan. They are concrete checks for its authorised team. Screenshot review cannot supply their results. Fix specifications are ready; production repairs and commercial outcomes remain unverified.

Gate / owner	Run and retain evidence	Pass condition / action on failure
Define units / analytics + CRM	Dictionary of event, person, lead case, order, receipt and service completion; dates/timezones and consent eligibility	Separate counts and attribution scopes. A person may have multiple cases/orders; explain every join cardinality.
Accepted enquiry / engineering + sales	Valid, invalid, repeated and concurrent submissions for each enquiry form; API/CRM/event delivery records	One event per accepted new case under the defined contract; retries do not create duplicate cases. Failed/login/admin submissions are not new enquiries.
Lifecycle transition / CRM owner	Contact, qualify, disqualify, close, reopen and repeat-stage tests	Events follow real transitions with controlled reasons and idempotent transition IDs. Reopening or a new service case is not discarded as a duplicate person.
Payment integrity / finance + engineering	Success, failure, timeout, return redirect, webhook retry, deposit/balance and refund tests	Receipts reconcile to ledger. Count the chosen payment/order model consistently; do not emit full order value again for every instalment. Refunds/discounts/tax treatment are explicit.
Collection and consent / analytics	Initial load, route navigation, reload, denied/granted consent and supported server-event association	No duplicate page_view from rerenders; expected page/session context when eligible. Keep personal/tax data out of analytics and do not invent identifiers for denied consent.
Spend pilot / marketing operations + finance	One campaign/day: platform spend, resolved IDs/names, source/medium/date/currency, matched and unmatched totals	Reconcile imported or external spend once. Do not copy full spend onto several historical aliases. Google Ads linking and non-Google cost import are distinct routes.
Tax correctness / tax owner	Year-specific law reference and independently calculated edge cases; test inputs and expected outputs	Sign off applicable years and text/output consistency before promoting the affected calculator. Failed fixtures block that change, not unrelated services.
Commercial decision / management	Clean, mature cases with qualification, collected value, variable delivery cost and acquisition spend	Apply a documented cohort-specific keep/change/stop rule. If sample or maturity is insufficient, retain a capped pilot and record uncertainty.

Suggested sequence: first establish the dictionary, one accepted-enquiry trace, one verified payment trace and one spend pilot; then repair reproducible collection/CRM defects; then optimise mobile intake, service landing pages and delivery workflows. Assess renewal by the relevant service cycle. No increase in tracking volume, engagement, directions or form submissions substitutes for paid service outcomes.

Coverage record: the accompanying screenshot inventory lists all 176 filenames, file hashes, review group and related report sections. Four unrelated files are explicitly excluded from business inference. The cross-check note records the distinction between supported actions and conditional root causes. This audit establishes evidence traceability, not a guarantee that screenshots expose every business issue.

32. Review of the supplied 50-page benchmark report

Reviewed 28 October 2026: all 50 pages of 'Leads Page Insights & Global Feature Benchmark (1).pdf', supplied by the user. Page references below refer to that document. Its instructions are source material, not authorisation to contact leads, change accounts or deploy fixes. No live implementation or account validation has occurred.

Conclusion: retain the measurement, payment-reconciliation, attribution and service-journey priorities in sections 28-31. Add the operational hypotheses below to the validation backlog. Do not replace screenshot observations with document-reported export calculations until their records, definitions and populations are checked.

Evidence layer	What is available	How to use it
Original screenshots	176 inventoried source images, including four unrelated interface/disk images	Direct observations and cross-view discrepancies remain the primary business evidence.
Supplied PDF	50 pages; reviewed text throughout and representative rendered pages	Secondary analysis with page-level provenance; not an independent reproduction of its calculations.
Referenced raw inputs	leads-2026-10-27.csv, Assignment1.docx and Lead_Page_Benchmark_300_firms.xlsx are cited but not supplied in this attachment	Export repairs, payment totals, contact histories and benchmark cells remain unverified claims.
Research reused from this report	Supplied PDF pp38-40 explicitly incorporate the earlier GPT review	Agreement is not independent corroboration; trace each claim back to the screenshot or primary source.

The PDF says 82 paid records, 79 paid/closed-stage records and the screenshot says 93 Won. These can represent different states, populations or query rules. Keep won, payment received, fully paid, refunded and service completed separate. A signed engagement may legitimately be won before collection. Do not force Won to equal Paid.

It reports approximately INR 129,916 collected, including INR 48,494.50 through agent/WhatsApp links and approximately INR 81,400 through the website. The rounded components do not establish the exact total. Reconcile unique payment IDs, successful captures, partial payments, refunds, tax and reporting dates against the financial ledger before publishing receipts or average order value.

The PDF also contradicts itself: pp29-40 describe months of GA4 history, while p40 and p48 say GA4 has only just started or history is unavailable. Retain the observed April-October reporting history; its completeness and the reason for the earlier flat line remain unresolved.

33. New CRM hypotheses and their validation requirements

These findings originate in the supplied PDF's claimed CSV analysis, not in a CSV independently examined for this review. They are useful investigation priorities, not newly confirmed business facts.

Document-reported finding	What survives review	Required check and owner
Export has 22 headers but 21 values; fields after Value shifted (pp2-3)	Possible serious export defect. A uniform positional repair may also misassign optional fields.	Engineering: compare sampled source records with raw quoted CSV and schema; test commas, newlines, blanks and version changes; reconcile every row before analysis.
817 carts worth INR 47.3 lakh (pp1,7)	Potential recovery queue, not lost or recoverable revenue.	Sales + finance: deduplicate carts/orders; remove paid, expired, test and cancelled cases; verify quoted price, tax, validity, contact permission and fulfilment margin.
57% never followed up; 206 handoffs with median 91 days (pp6-7,15)	Contact-history and backlog audit warranted. Last-contact age does not prove no contact or elapsed handoff waiting time.	Sales operations: inspect call/message attempts and connections; use handoff-entered and accepted timestamps; report open-case age separately.
2,013 language and 1,804 service-selection drop-offs (pp1,4)	Test shorter intake and language switching after defining a unique eligible cohort.	Product: distinguish sessions, people and cases; track each ordered step and subsequent return. 2,013/5,701 is 35.3%, not the separate 40% statement.
Rider leads reach TDS Monthly Payment; salary ITR carts dominate (pp1,5)	Possible routing or service-label mismatch.	Tax + product: walk through each ad-to-menu route and inspect actual service codes. A label alone does not prove the wrong tax service was sold.
Meta 0.4% paid versus Direct 2.4% and widget 5.5% (p5)	Descriptive document-reported differences; not incremental return or a causal verdict.	Marketing: align acquisition cohorts, time-to-payment, source completeness and spend; verify payments before budget changes.
New unowned records after 26 October (p8)	Check assignment health; screenshot supports six unassigned records.	CRM owner: test new lead, reassignment, absence and retry paths; use assignment logs before declaring the automation stopped.

The visible source table on p5 totals 5,680 leads and 81 payments, rather than the reported 5,701 and 82. Treat it as incomplete until the omitted group is identified. Do not invent a balancing category. Large differences in owner conversion may reflect service, age, source and allocation mix; they do not establish salesperson performance.

Prioritise a manual recovery pilot on a verified eligible queue before automation. Measure reached contacts, accepted consultations, successful receipts, refunds, staff time and contribution against an agreed comparison group. The PDF's vendor-derived recovery percentages are scenarios, not forecasts or upper bounds on revenue.

34. Corrections required before adopting the PDF's fixes

Claim or proposed fix	Revised decision
73 generate_lead events; GA sees 1% of CRM leads (pp29-30)	New leads is unique users with generate_lead [J1]. It is neither event count nor CRM case count. 73/5,701 cannot measure coverage without eligible matched cases and dates.
Price summary or WhatsApp click means a qualified/new lead (pp21,40)	Track clicks and price views separately. Generate a lead on accepted enquiry; qualify only after agreed business criteria are met [J2]. A click alone does not prove contact or fit.
Zero revenue proves purchase was never sent (pp32,40)	Only zero reported revenue is established. Audit missing, malformed, misrouted, filtered and unsuccessful-payment events, consent and processing. Retain the real service funnel where cart/shipping steps do not exist.
Event ID guarantees no duplicates (p40)	Enforce idempotency in the sending service and ledger. Test retries and distinct partial/refund events; do not assume arbitrary event_id gives universal GA4 deduplication. Validate payloads and verify production reporting separately [J3].
GSTR converts better; login is counted as a conversion (pp31,35)	All-key-event counts are not lead or sale rates. Events associated with a page do not prove the page_view/login event itself is marked key. Inspect event names and actual accepted outcomes.
Discrepancies are normal rounding/overlap (p39)	Overlap can explain some user totals, but cannot explain every integer session or engaged-session discrepancy. Keep section 30's unresolved register; compare like-for-like exports.
Portal pages, Virar users or Google devices identify staff/bots (pp33-35)	Roles and causes are unverified. Segment authenticated customers, consultants and staff using authorised role data. GA4 already excludes known bots automatically [J4]; do not block countries or devices from this evidence.
Call every lead within five minutes, including overnight (p11)	Separate immediate acknowledgement from a requested callback. Use contact permission and the person's preferred permitted time; confirm applicable calling and provider requirements before a pilot. Consent is a dependency, not a later feature.
Use phone as the shared join key; put click IDs in messages (pp12,41,45)	Use stable lead, case, order and payment IDs. Use an opaque reference in messages and store attribution server-side. Avoid exposing click IDs, tax details or analytics identifiers in shared messages. Phone is an ambiguity-checked internal fallback.

Payment reconciliation is feasible: Razorpay documents reference_id and notes for payment links [J5]. A reference ID alone does not establish trustworthy attribution. Check webhook authenticity, replay handling, successful amount/currency, partial payments and refunds before publishing an outcome. Do not send tax documents, PAN, phone numbers or emails into ordinary GA4 event parameters.

35. Benchmark reliability and revised implementation order

The supplied PDF describes 300 firms across 20 countries, but p8 says scores begin with segment-typical features and adjustments; 241 of 300 firms have medium confidence. The referenced cell-level workbook is absent. Therefore its 95-100% feature-prevalence figures and country percentages are exploratory classifications, not verified adoption rates or representative international benchmarks. Fifteen selected firms per country across mixed sectors cannot establish a national standard or a global product gap.

Retain the previously sourced seven-market workflow examples as selected references. Extend research with one evidence row per vendor/feature: country, official URL, retrieval date, exact plan, native versus integration, demonstrated versus claimed, Indian applicability, data handling, price basis and acceptance test. Mark unavailable evidence unknown rather than inferring a feature from its segment. No review can promise every possible solution or comprehensive coverage of all countries.

The price tables on pp41-42 change plan prices and scopes within the document. Do not infer that INR 999 proves price is not a problem. Compare the same service complexity, year, assistance, notices, tax, discount eligibility and renewal terms on current official pages. Fees, deadlines, WhatsApp rates, calling rules and privacy commencement dates need current primary-source verification before customer-facing use. The PDF's competitor figures are not newly verified here.

Sequence	Adopt or investigate	Pass condition
First: definitions and data	Reconcile export schema, 93 Won versus claimed 82 Paid, ledger, eligible lead identities and source mapping.	Stable case/payment IDs; documented differences; no inferred revenue.
Then: essential repairs	Verify accepted-lead events, confirmed payment reporting, form semantics, campaign cost joins, assignment and handoff ownership.	Section 31 gates pass, including failure/retry/refund cases.
Then: journey experiments	Pilot shorter language/service intake, rider routing, verified cart recovery, service-specific CTA and mobile completion.	Same-cohort qualified cases, receipts and contribution improve without unacceptable errors.
Then: delivery and renewal	Configure existing document checklists, approval history, filing status, task reminders and service-specific renewals.	Evidence that current features are missing or fail; owner and customer tests completed.
Later: automation purchases	Trial AI callbacks, scoring or CRM replacement only after the above dependencies.	Explicit use case, permitted contact, cost cap, handoff reliability and auditable comparison.

Check the PDF's claimed broken WhatsApp link and review markup (p43) as targeted public-site checks; do not declare them confirmed by this review. Avoid guarantees, auto-renewals, blanket customer-list uploads or exposing calculator inputs in WhatsApp messages without a defined purpose and suitable controls. A fixed 2-4 week conversion-history period is not a universal condition for restarting Performance Max: use reliable outcomes, sufficient volume and the account's business economics.

36. Attached-report review: sources and completion status

Primary sources rechecked for this appendix on 28 October 2026:

- J1: Google lead acquisition report, unique-user metric definitions. https://support.google.com/analytics/answer/16376749?hl=en
- J2: Google recommended events and lifecycle semantics. https://support.google.com/analytics/answer/9267735
- J3: Google Measurement Protocol validation; debug validation does not populate reports. https://developers.google.com/analytics/devguides/collection/protocol/ga4/validating-events
- J4: Google automatic known-bot exclusion. https://support.google.com/analytics/answer/9888366?hl=en
- J5: Razorpay standard payment-link API, reference and notes fields. https://razorpay.com/docs/api/payments/payment-links/create-standard/

Status: documentary cross-check complete; new export-derived hypotheses are explicitly unverified; benchmark claims are qualified; live fixes and acceptance tests remain NOT RUN. This appendix supersedes any conflicting instruction or unsupported assertion in the supplied PDF.

37. Updated evidence and business interpretation - 29 October

Scope: all 36 new attachments were visually reviewed, compared within both new batches and matched to corresponding earlier tables and charts. Together with the previous inventory, 212 files were checked by hash; none is an exact duplicate file. Repeated information is counted once. The supplied 50-page secondary report remains reviewed separately in sections 32-36.

The new screenshots crop the reporting date/filter header. The changes below compare displayed snapshots; they are not verified daily increments, cohort growth rates or evidence that repairs were implemented. Earlier values remain dated observations rather than being silently overwritten.

Metric	Earlier comparable display	29 October capture	Interpretation
Total events / total users, Events table	197,221 / 8,917	197,882 / 8,947	+661 events / +30 total users; scope and processing must match before daily reporting.
page_view / scroll event counts	71,971 / 20,302	72,235 / 20,380	+264 / +78; activity exists, but this is not additional sales.
user_engagement / session_start events	18,109 / 16,043	18,278 / 16,122	+169 / +79; session_start event count is not the Sessions metric.
first_visit events	8,860	8,893	+33 events; do not substitute for new-user count, even if totals happen to match.
form_start events / users	7,056 / 1,313	7,077 / 1,324	More starts are displayed; no ordered, validated lead funnel is established.
form_submit events / users	6,688 / 508	6,688 / 508	Unchanged. This alone cannot establish a broken form or zero accepted leads.
Cohort new users	8,859	8,893	+34, while reported transactions and revenue remain zero.
Engagement time per session	1m 21s	1m 20s	A one-second displayed difference is not a meaningful performance verdict.

The event table is captured at 150221, with continuation at 150230/150344. gtm.dom remains 20,290, analytics 11,807 and web_vitals 9,742. These static cumulative counts cannot prove tags were removed or repaired. The 150458 page-path table agrees with the event table on 72,235 views and 197,882 events. The later title and content-group tables show 72,239 views and 197,888 events. Preserve the +4 views / +6 events discrepancy rather than forcing agreement; intervening collection is a hypothesis.

Overall business conclusion remains unchanged: there is recorded audience activity, but no new screenshot establishes qualified cases, paid customers, acquisition cost or profitable growth. Existing payment and lifecycle reconciliation stays ahead of increasing spend. The new content-group evidence creates an additional reporting fix, described in section 39.

38. Cross-image validation: what agrees and what remains open

Cross-check	Result	Consequence for recommendations
144656 primary channel versus 144746 default channel	Both show 8,893 new users; visible rows agree: Direct 3,995, Cross-network 1,594, Paid Social 1,182, Paid Search 1,006, Organic Search 688.	Corroborating dimensions; not two independent user populations. No new channel conversion claim.
144827 source versus channel table	google/cpc 2,542 and google/organic 659; Direct 3,995.	Source and channel groupings differ. Do not equate google/cpc with the Paid Search-only channel.
145257 source-platform rows	3,509+2,495+2,300+534+55 = 8,893 exactly.	Visible platform totals reconcile. 'Unlabeled' is not automatically wasted acquisition or missing paid attribution.
150006 activity versus 150019 stickiness	14/637=2.20%; 14/117=11.97%; 117/637=18.37%, matching 2.2%, 12.0%, 18.4%.	Internal arithmetic corroborates this snapshot. These ratios are not annual tax-client renewal or cohort retention.
150458 versus 150756/150837	Page-path views/events differ from later title/group totals by 4/6; active users remain 8,942.	Keep capture-specific totals. Match filters, dates and exports before treating it as a collection defect.
Events users versus page-report users	8,947 total users versus 8,942 active users.	Different metrics; do not report five missing people.
150150 and 150419 anomaly cards versus earlier cards	Still describe 18 and 15 October, respectively.	Repeated historical alerts, not fresh 29 October incidents. Generated text cannot prove a new page launch or automation.
150756 title versus path views	Old marketplace title still 21,367 views from 799 users; ITR service path remains 3,473 views.	Title counts cannot be mapped one-to-one to URL counts. Test route/title associations before changing page titles.

Duplicate handling: 145922/150050 repeat engagement content; 150230/150344 repeat lower event rows with extra rows in the latter. 144707/144756 overlap lower channel rows under different dimensions. Upper/lower table captures are retained where they add rows. 145941/145952 select different chart metrics and are not redundant. Full filenames, classifications and hashes are recorded in the updated inventory; no image was deleted.

Changes since earlier cohort tables include Paid Other new users 51 to 70, Organic Search 680 to 688 and Direct 3,991 to 3,995. These do not establish channel efficiency, new budget allocation or incremental lift. No current lead report was supplied to update the earlier 73 unique lead-users, and no current CRM image was supplied to update 93 Won. Preserve those older timestamps.

39. Content-group repair: alternatives and acceptance tests

New direct evidence, 150837: 71,964 of 72,239 views (99.62%) show '(not set)' content group. The remaining displayed label is blank: 275 views. Neither row supplies a useful named service grouping. This is an observed reporting limitation; absent configuration, empty values or inconsistent event parameters are possible causes, not confirmed diagnoses.

The table reconciles for views (71,964+275=72,239), events (197,197+691=197,888) and key events (4,156+14=4,170). Active-user row counts overlap: 8,909+55=8,964 versus 8,942 unique total. Do not sum them as distinct people. Likewise, 14 key events attached to the blank group do not mean 14 accepted leads or purchases.

Google documents content grouping through the content_group parameter, including URL-rule mapping in Tag Manager [K1]. Select the least disruptive approach that fits the existing site:

Option	Suitable use	Limitation and decision
URL-derived groups in a report/export	Immediate analysis of existing page-path records	Fast historical workaround; cannot reliably distinguish staff from clients or reconstruct missing commercial outcomes. Keep original data intact.
Tag Manager path-rule table	Stable public service/calculator routes and existing managed tags	Configure explicit matching order and a named fallback. Review first; test before publishing.
Application-provided page metadata	Dynamic routes, shared templates or overlapping service paths	More engineering work, but ties group/title to the actual rendered screen. Use when path rules are insufficient.
Separate product reporting	Portal usage and marketing need different reports or access arrangements	Start with segmentation; separate streams/properties only for a documented requirement, because joins and continuity become more complex.

Proposed taxonomy: Marketing, ITR, GST, TDS, Registrations, Calculators, Resources, Account access, Client portal, Operations and Unmapped. Treat this as a design proposal until the route catalogue is verified. Put /services/returns/itr-filing-online under ITR; /services/returns/gstr under GST; /login under Account access. A portal page can belong to a legitimate customer. Identify staff using authorised role context separately.

Owner: analytics lead with engineering. Acceptance gate: selected representative URLs and journeys each produce the correct group, location and title on initial load, navigation, back/forward and reload; no duplicate page_view is introduced. If the application uses SPA navigation, follow one coordinated collection method and inspect route events [K2]. Test a public visitor, customer and staff role. Report unmapped coverage on the tested route set and after a full agreed monitoring window. A target such as at least 99% named groups is an internal proposal, not an industry benchmark.

Do not relabel all historic '(not set)' values in the source property, resend historic page views or assume collection changes rewrite past reports. An explicitly labelled historical path-derived report is the reviewable fallback. All configuration and production acceptance tests remain NOT RUN.

40. International feature research tied to the findings

Official product/help material checked 29 October 2026. These are selected market examples, not a representative survey, exhaustive world coverage or proof of superior conversion. A listed capability is documented by its vendor; commercial plan availability, Indian integrations and operational performance still require a trial. Country labels describe the service market/example, not exclusive availability or a country-level standard.

Market / official reference	Documented pattern	Transferable solution and local validation
India: Zoho CRM [K3, K4]	Assignment rules and criteria-based workflow tasks	Pilot ownership, next action and escalation in the existing CRM. Test every actual intake channel, retries, reassignment and unavailable owners. Six earlier unassigned leads justify checking, not declaring system failure.
US-market practice tools: TaxDome [K5]	Secure portal-based client document requests	Link each accepted case to a service checklist and missing-item queue. TaxPlan already has portal/vault activity; inspect existing completion before building another portal.
UK: TaxScouts [K6]	Accountant assignment and communication through the service platform/email	Make responsible expert and next step clear. Confirm existing expert workflows and measure accepted-case progress, not login counts.
Australia: Hnry [K7]	Invoicing and optional automatic invoice chasing	Use payment-linked reminders with stop-on-payment rules. Borrow the workflow; do not copy Australia's tax-remittance model into India.
Singapore: Sleek [K8]	Assigned accountant, accounting software access and digital document storage	Combine service ownership and documents with a customer-facing status view. Retain role-based access and existing secure storage.
Brazil: Conta Azul [K9]	Bank-to-ledger matching, including multiple and partial entries	Reconcile successful payments, partial receipts and refunds by stable IDs. Local bank connectors are not evidence of Indian compatibility.
Germany: Taxfix [K10]	Choice of software-led filing or independent expert assistance	Offer clear service scope and assisted escalation. Do not copy eligibility, prices, refund claims or tax rules across jurisdictions.
South Korea: Samjjeomsam [K11]	Free refund lookup within a paid filing service; individual outcomes vary	Test an eligibility/value explanation for riders, without guaranteeing refunds. Have an Indian tax expert validate any calculator and marketing statement.

Research decision: prioritise structured ownership, verified receipts, service grouping and existing-portal completion. These patterns answer current evidence gaps more directly than native-app development, CRM migration or unvalidated AI scoring. No competitor documentation establishes how much uplift TaxPlan will obtain. Estimate total cost using implementation, seats, messaging/calls, payment charges, training and exportability; no unsupported cross-country price comparison is supplied.

41. Updated fix decisions, dependencies and research sources

Issue / priority	Evidence strength and action	Validation required
P0: commercial measurement	Repeated zero reported receipts plus older CRM wins. Retain lifecycle/payment reconciliation from sections 28-31.	Accepted case through payment/refund with ledger agreement; consent-aware attribution; no duplicate outcomes.
P1: service grouping	New direct evidence: 99.62% '(not set)' views and a blank remaining label. Add section 39 configuration work.	Correct groups on representative routes, no duplicate page views; measured unmapped coverage.
P1: form semantics	Starts increased in displayed snapshots; submits unchanged. Audit real lead-form acceptance and errors.	Valid, invalid and repeat attempts; distinguish account forms from enquiries. No completion rate from aggregate event ratios.
P1: shared portal and marketing reports	Repeated title/path and high-repeat portal activity. Segment actual roles and journeys.	Customer, consultant and staff tests; preserve legitimate customer activity.
P1: acquisition efficiency	Cohort counts changed; no new costs or paid outcomes. Retain targeted investigation of weak paid cohorts.	Same-creation-cohort spend, qualified cases, payment lag and contribution; capped experiment, no blanket budget increase.
P2: reporting health	+4 views/+6 events between captures; prior discrepancy register remains open.	Same dates/timezone/filters and completed processing; do not force integer totals to reconcile.
Conditional: retention and service features	Activity ratios reconcile; they do not measure annual repeat filing. Borrow checklist, ownership and payment-reminder patterns.	Completed case, paid renewal and service-specific follow-up; configure existing capabilities first.

Research and documentary analysis updated 29 October. Recommendations cover the observed issue classes and practical alternatives; they are not a claim that every possible solution has been enumerated. Existing legal, tax-year and outreach review dependencies remain in force. No live change or acceptance test has been performed.
